Traditional Cantilever Bearing Suspension

Labels in diagram:

- UPPER BEARING
- SQUARE RINGS
- ELECTRIC MOTOR
- SPRING CAP
- PRELOAD SPRING
- BODY
- LOWER BEARING
- BOTTOM FLANGE

Accelerate for Growth VPD FY13 Agilent Restricted Page 3

Traditional Cantilever Bearing Suspension (cont'd)

Rotor Suspension Scheme

Labels in diagram:

- Square ring (radial support)
- Spring (bearing axial preload)

Rotor suspension design parameters:

- Square Ring Stiffness and Coefficients of Friction
 - Reduce vibration transmitted from rotor to body
 - Compensate geometrical error in bearings location
 - Angular misalignment
 - Concentricity
- Preload spring
 - Provides proper alignment and loading of balls, cage and races

AFS: Mechanical Design

- SST shaft mechanically fastened to Al rotor to provide rotor stability (bending effect, behavior under external shock loads)
- Agilent Floating Suspension
 - Guaranteed bearing alignment (AFS components' geometrical precision)
 - Optimized rotor dynamics: balance & stability (through increased radial stiffness)
 - Constant bearing preload (lower AFS acts as an axial spring)
 - Excellent resistance to external shocks (tested up to 235 g)
 - Reduced acoustic noise
 - Thermal stability
 - Benefits are independent of orientation

Accelerate for Growth

VPD FY13 | Agilent Restricted | Page 6

AFS: Mechanical Design cont'd

- AFS geometrical precision guarantees perfect bearing alignment
- Designed radial stiffness, optimize rotor dynamic behaviour and acoustic noise
- Lower AFS act as an axial spring providing bearings' preload and rotor axial positioning

- Radial guard and S-ring made of new conductive material
- Spring for additional thermal contacts
 - lower bearing temperature

Accelerate for Growth

VPD FY13 | Agilent Restricted | Page 7

Mechanical Design Summary

- **Upper AFS** → better unbalance stability (both Axial/radial Stiffness)
 - Damping
 - Guarantee axial contact between bearing and soft shoulder
- **Lower AFS** → low fretting risk Axial/radial Stiffness
 - Damping
 - Guarantee bearings preload
- **New high-conductive rubber** → lower bearing temp
- **Additional thermal contacts** → lower bearing temp
- **New bearing (double shielded)** → higher MTTF
- **SST shaft** → lower deformation in resonance → lower unbalance
- **Conservative clearances calculation** → low crash risk

AFS vs Conventional Suspension

The image shows a side-by-side comparison of AFS and conventional suspension systems. On the left, the AFS system is shown with its upper and lower bearings. On the right, the conventional system is shown with its square-rings. The AFS system is designed for better alignment and load distribution.

Features and Benefits of AFS

- ✓ Continuous alignment and correct load to the bearings
- ✓ Ability for the rotor to adjust to external forces
- ✓ Superior resistance to outside shocks and vibrations
 - Tested to 230 g in drop tests while running
- ✓ Reduction from 5 tunable components to 2 tunable components
- ✓ Scalability of the AFS system over a wide range of rotor/pump sizes
- ✓ Improved reliability by design
- ✓ Reduced noise and vibration levels emitted from the pump

Vibration Test

4 Pumps tested in horizontal, vertical and upside position

Pump position	Operative (5-500Hz)	Non-Operative (5-500Hz)
Horizontal	0.2grms	2grms
Vertical	0.2grms	2grms
Upside-down	0.2grms	2grms

Operative: Pump tested in nominal working conditions (pump ON). After the test the pump must be able to work as good as new.
Non Operative: Pump not running (pump OFF) to simulate transportation and storage. The pump after the test must work as good as new.

VPD FY13 | Agilent Restricted | Page 12

Temperature Test

4 Pumps tested in horizontal, vertical and upside position.

Pump position	Operative	Non-Operative
Horizontal	0°C to 40°C	-40°C to +70°C
Vertical	0°C to 40°C	-40°C to +70°C

Entire thermal cycle = 80 hours

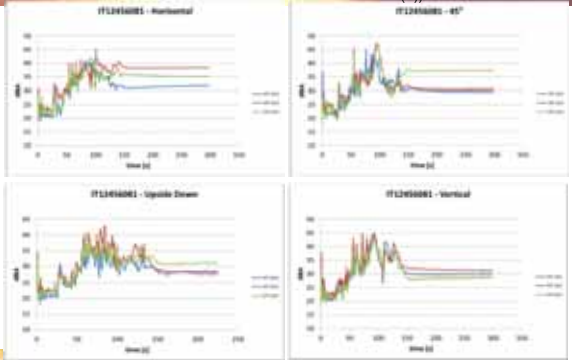

Operative: Pump tested in nominal working conditions (pump ON). After the test the pump must be able to work as good as new.
Non Operative: Pump not running (pump OFF) to simulate transportation and storage. The pump after the test must work as good as new.

Reliability assessment tests on Agilent GCMS

- Non-operational shock test:** system drop with pump not running, after each drop pump is switched on and after stabilization unbalance, Fourier spectra, power adsorption and bearing temperature are acquired.

On going Life Tests

20 pumps in accelerated life test since September 2012.

All pumps still working as of today (end of August 2013)

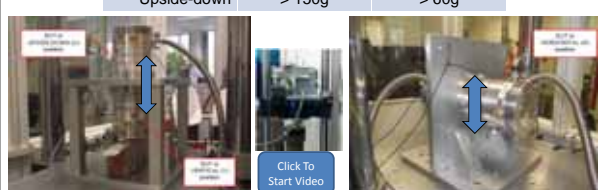

- Pumps operating 24/7 at 55°C under argon gas load.
- Ambient temperature 25°C.
- Power > 100W
- Pumps stopped once a day under vacuum in 45 minutes staying on resonances frequencies for most of the time.

AFS use in Portable Mass Spectrometry Applications

- AFS represents a major step towards allowing Turbo Pumps to meet the needs of HEMS instruments:

- Ruggedness
- Reliability by Design
- High Performance
- Resistance to Impacts
- Universal Orientation
- Reduced Power
- Reduced Noise & Vibration
